LaTeX Example #1

Jeremy Pedersen

2023-01-03

1 First section

We can use the listing package to place source code into our documents from a file:

```python
#
# A Rangoli Generator
#
# Author: Jeremy Pedersen
# Date: 2019-02-18
# License: "the unlicense" (Google it)
#

# Define letters for use in rangoli
alphabet = 'a b c d e f g h i j k l m n o p q r s t u v w x y z'.split()

# Read in rangoli size
size = int(input("Set size of rangoli: "))

# Calculate maximum linewidth (how much fill do we need per line)
maxWidth = size*2 - 1 + (size - 1)*2

# Generate rangoli
for i in list(range(size-1,0,-1)) + list(range(0,size)):
    left = alphabet[1+i:size]
    left.reverse()
    right = alphabet[0+i:size]

    center = '-'.join(left + right)

    padding = '-'*((maxWidth - len(center))//2)

    print(padding+center+padding)
```

test_code.py

Or we can quote a range of line numbers from the file (lines 19 and 20, for example):

```python
for i in list(range(size-1,0,-1)) + list(range(0,size)):
    left = alphabet[1+i:size]
```

test_code.py

We can also place code directly into latex without importing it from a file:

```python
print("Hi, I'm Python 3!")
```

1.1 First subsection

We can create and format mathematical expressions like so:

$$x' = x \cdot scos\theta - y \cdot ssin\theta + t_x$$
$$y' = x \cdot ssin\theta + y \cdot scos\theta + t_y$$

We can also make a nice list:

1. I am the first thing in the list

2. I am the second thing in the list

We can inline mathematical expressions such as this one "$4\sigma_0$" using the "\$" sign. We can make mathematical expressions that occupy their own line, like this:

$$u = (x - x_0)\frac{1}{4\sigma_0}cos\theta_0 - (y - y_0)\frac{1}{4\sigma_0}sin\theta_0 + 4 = (0 - 16)\frac{1}{4} - 0 + 4$$

1.2 Second subsection

We can also make tables and charts using the array type like so:

$$\phi = \left\{ \begin{array}{ll} \theta_0 + \theta_{pt} & if\ \theta_0 + \theta_{pt} \in [0, 2\pi) \\ \theta_0 + \theta_{pt} + 2\pi & if\ \theta_0 + \theta_{pt} < 0 \\ \theta_0 + \theta_{pt} - 2\pi & if\ \theta_0 + \theta_{pt} \geq 2\pi \end{array} \right\}$$

I can start an enumerated list of items here...

1. One thing

2. Another thing

And then...

2 Second section

...I can continue it here!

3. Yet more stuff

4. Some other things

Inserting figures is also relatively easy to do:

Figure 1: I can embed images too

We can make a table with centered elements:

$$\begin{bmatrix} 1.1754 & -0.8334 & 193.4191 \\ 0.2062 & 1.0380 & -141.0333 \\ -0.0008 & 0.0007 & 1.0000 \end{bmatrix}$$

There you go! That should be enough to get you started on LaTeX!
